GULF STATES MARINE FISHERIES COMMISSION

COMMISSIONERS

ALABAMA

Mr. John W. (Toppy) Hodnett
AL Dept. of Conservation
and Natural Resources
64 North Union Street
Montgomery, AL 36104

Rep. Taylor F. Harper
AL House of Representatives
P.O. Box 229
Grand Bay, AL 36541

Mr. John Ray Nelson
Bon Secour Fisheries, Inc.
P.O. Box 60
Bon Secour, AL 36511

FLORIDA

Dr. Elton J. Gissendanner
Executive Director
FL Dept. of Natural Resources
3900 Commonwealth Blvd.
Tallahassee, FL 32303

Rep. Sam Mitchell
FL House of Representatives
P.O. Box 299
Chipley, FL 32428

Mr. Clyde Richbourg
Route 2, Box 235G
Milton, FL 32570-9802

LOUISIANA

Mr. J. Burton Angelle
Executive Secretary
LA Department of Wildlife
and Fisheries
P.O. Box 15570
Baton Rouge, LA 70895

Mr. Leroy Kiffe
Route 1, Box 239
Lockport, LA 70374

Rep. Frank J. Patti
LA House of Representatives
P.O. Box 53
Belle Chasse, LA 70037

MISSISSIPPI

Mr. Lon Strong
Executive Director
MS Department of Wildlife
Conservation
P.O. Box 451
Jackson, MS 39205

Rep. Ted Millette
MS House of Representatives
Box 1177
Pascagoula, MS 39567

Mr. Holton D. Turnbough
WGUF Radio Station
P.O. Box 789
Gulfport, MS 39501

TEXAS

Mr. Charles D. Travis
Executive Director
Texas Parks and Wildlife Dept.
4200 Smith School Road
Austin, TX 78744

Sen. H. Tati Santiesteban
Texas Senate
747 East San Antonio, Suite 100
El Paso, TX 79901

DEDICATION

Representative John B. Breaux
7th District, Louisiana
Chairman, Fisheries, Wildlife,
Conservation and the Environment
Subcommittee
U.S. House of Representatives

Representative Trent C. Lott
5th District
Mississippi Minority Whip
Rules Committee
U.S. House of Representatives

For their steadfast belief in State-Federal cooperative fishery research and management, and their efforts to secure support and funding in the critical early years of the SEAMAP Program, this document is dedicated with appreciation to U.S. Representatives Trent C. Lott (Mississippi) and John B. Breaux (Louisiana). Their perseverance and leadership in protecting, restoring and developing the nation's fishery resources have earned them the sincere gratitude of the Southeast Area Monitoring and Assessment Program.

ACKNOWLEDGEMENTS

The 1984 SEAMAP Atlas was developed, as a cooperative effort between the five Gulf States fishery management agencies and the National Marine Fisheries Service (NMFS), to present information collected during SEAMAP research survey activities in the Gulf of Mexico. The SEAMAP Data Coordinating Work Group would like to thank the following agencies for their participation in the project: Florida Department of Natural Resources, Alabama Department of Conservation and Natural Resources, Gulf Coast Research Laboratory (representing the Mississippi Department of Wildlife Conservation), Louisiana Department of Wildlife and Fisheries, Texas Parks and Wildlife Department, and NMFS, Southeast Fisheries Center.

Special thanks go to Dr. Andrew J. Kemmerer, Director, NMFS Mississippi Laboratories, to laboratory personnel Rick Minkler, Mark McDuff, Linda Magee, John Brucks, Bennie Rohr, Scott Nichols, Velda Harris, and Jim Benton; to Leslie Bruce of the Gulf Coast Research Laboratory; and to the Gulf States Marine Fisheries Commission staff for their assistance in preparing this atlas.

LIST OF TABLES

	PAGE
Table 1. Selected environmental parameters measured during 1984 SEAMAP surveys in the Gulf of Mexico, by individual survey.	10
Table 2. SEAMAP Shrimp and Bottomfish Survey species composition list, all trawl stations. Species with a total weight of less than .05 lb (22.7 g) are indicated on table as 0.0 kg.	39
Table 3. Statistical Zone 9. Summary of the environmental data (X), the standard error of the mean (SEM) and the number of samples taken (n) during the June-July 1984 SEAMAP Shrimp and Bottomfish Survey by depth stratum. Temperature in °C, salinity in ppt and oxygen in ppm. No trawl sampling was done in statistical zone 9. Plankton station only.	50
Table 4a. Statistical Zone 10; 40-ft trawls. Summary of dominant organisms, combined for all zones, taken in shrimp statistical zone 10 during the June-July 1984 SEAMAP Shrimp and Bottomfish Survey by depth stratum. The mean number (Num) of organisms per hour, the standard error of the mean (SEM) for numbers, the weight in kg per hour, the SEM of weight and the number (n) of samples taken. No samples were taken below 6 fm.	51
Table 4b. Statistical Zone 10; 40-ft trawls. Summary of dominant organisms taken within statistical zone 10 during the June-July 1984 SEAMAP Shrimp and Bottomfish Survey by depth stratum. The mean number (Num) of organisms per hour, the standard error of the mean (SEM) for numbers, the weight in kg per hour, the SEM of weight and the number (n) of samples taken. No samples were taken below 6 fm.	53
Table 4c. Statistical Zone 10; 40-ft trawls. Summary of the mean total catch and environmental data (X), the standard error of the mean (SEM) and the number of samples taken (n) during the June-July 1984 SEAMAP Shrimp and Bottomfish Survey by depth stratum. Catch values in kg per hour, temperature in °C, salinity in ppt, and oxygen in ppm. Alabama data on numbers and weights not included. No samples were taken below 6 fm.	55
Table 5a. Statistical Zone 11; 40-ft trawls. Summary of dominant organisms, combined for all zones, taken in shrimp statistical zone 11 during the June-July 1984 SEAMAP Shrimp and Bottomfish Survey by depth stratum. The mean number (Num) of organisms per hour, the standard error of the mean (SEM) for numbers, the weight in kg per hour, the SEM of weight and the number (n) of samples taken.	56

Table 5b. Statistical Zone 11; 40-ft trawls. Summary of dominant organisms taken within statistical zone 11 during the June-July 1984 SEAMAP Shrimp and Bottomfish Survey by depth stratum. The mean number (Num) of organisms per hour, the standard error of the mean (SEM) for numbers, the weight in kg per hour, the SEM of weight and the number (n) of samples taken.	58
Table 5c. Statistical Zone 11; 40-ft trawls. Summary of the mean total catch and environmental data (X), the standard error of the mean (SEM) and the number of samples taken (n) during the June-July 1984 SEAMAP Shrimp and Bottomfish Survey by depth stratum. Catch values in kg per hour, temperature in °C, salinity in ppt, and oxygen in ppm.	60
Table 6a. Statistical Zone 13; 40-ft trawls. Summary of dominant organisms, combined for all zones, taken in shrimp statistical zone 13 during the June-July 1984 SEAMAP Shrimp and Bottomfish Survey by depth stratum. The mean number (Num) of organisms per hour, the standard error of the mean (SEM) for numbers, the weight in kg per hour, the SEM of weight and the number (n) of samples taken. No samples were taken below 6 fm.	61
Table 6b. Statistical Zone 13; 40-ft trawls. Summary of dominant organisms taken within statistical zone 13 during the June-July 1984 SEAMAP Shrimp and Bottomfish Survey by depth stratum. The mean number (Num) of organisms per hour, the standard error of the mean (SEM) for numbers, the weight in kg per hour, the SEM of weight and the number (n) of samples taken. No samples were taken below 6 fm.	63
Table 6c. Statistical Zone 13; 40-ft trawls. Summary of the mean total catch and environmental data (X), the standard error of the mean (SEM) and the number of samples taken (n) during the June-July 1984 SEAMAP Shrimp and Bottomfish Survey by depth stratum. Catch values in kg per hour, temperature in °C, salinity in ppt, and oxygen in ppm. No samples were taken below 6 fm.	65
Table 7a. Statistical Zone 14; 40-ft trawls. Summary of dominant organisms, combined for all zones, taken in shrimp statistical zone 14 during the June-July 1984 SEAMAP Shrimp and Bottomfish Survey by depth stratum. The mean number (Num) of organisms per hour, the standard error of the mean (SEM) for numbers, the weight in kg per hour, the SEM of weight and the number (n) of samples taken. None of the species listed were taken below 6 fm.	66
Table 7b. Statistical Zone 14; 40-ft trawls. Summary of dominant organisms taken within statistical zone 14 during the June-July 1984 SEAMAP Shrimp and Bottomfish Survey by depth stratum. The mean number (Num) of organisms per hour, the standard error of the mean (SEM) for numbers, the weight in kg per hour, the SEM of weight and the number (n) of samples taken.	68

INTRODUCTION

The Southeast Area Monitoring and Assessment Program (SEAMAP) is a State/Federal/university program for the collection, management, and dissemination of fishery-independent data (information collected without direct reliance on statistics reported by commercial or recreational fishermen) in United States waters of the Gulf of Mexico. A major SEAMAP objective is to provide the large, standardized data base needed by management agencies, industry and scientists to wisely manage and develop fishery resources for the least possible cost. To accomplish this goal, survey data must be disseminated in a useful format to SEAMAP participants, cooperators, and other interested organizations.

The SEAMAP Program began in March 1981 when the National Marine Fisheries Service (NMFS), Southeast Fisheries Center, presented a SEAMAP Strategic Plan (January 1981) to the Gulf States Marine Fisheries Commission (GSMFC). This strategic plan outlined the proposed program organization (goals, objectives, procedures, resource requirements, etc.); within the existing framework of the GSMFC, a SEAMAP Subcommittee was then formed. The Subcommittee consists of one representative from each state fishery management agency [Florida Department of Natural Resources (FDNR); Alabama Department of Conservation and Natural Resources (ADCNR); Mississippi Department of Wildlife Conservation (MDWC), represented by the Gulf Coast Research Laboratory (GCRL); Louisiana Department of Wildlife and Fisheries (LDWF); and Texas Parks and Wildlife Department (TPWD)], and one from NMFS Southeast Fisheries Center. The Subcommittee organized and successfully coordinated three assessment activities in 1982 - an April-May plankton survey; a June-July shrimp and bottomfish survey; and environmental sampling, in conjunction with the two surveys (see Stuntz et al. 1985) - and four assessment activities in 1983 - an April-May plankton survey, a June-July shrimp and bottomfish survey, a December plankton survey, and environmental sampling in conjunction with these three surveys (see Thompson and Bane 1986).

In March 1984, the SEAMAP Subcommittee identified the year's SEAMAP survey activities for the Gulf of Mexico. In keeping with the program goal of establishing a coordinated, long-term resource data base, it was decided to continue the same types of survey activities conducted in 1982 and 1983, but in addition, add a plankton survey for mackerel in August of 1984. Overall surveys objectives, as in 1982 and 1983, were to assess the distribution and abundance of ichthyoplankton and trawl-caught organisms, and document environmental factors that might affect their distribution and abundance. The basis for the plankton work was primarily assessment of tuna eggs and larvae in the open Gulf of Mexico (see Sherman et al. 1983), while the Texas Closure formed the basis for trawl-caught shrimp and bottomfish surveys (see Nichols 1982, 1984), and assessment of king mackerel eggs and larvae was the basis for the August Plankton Survey.

As previously stated, a major purpose of SEAMAP is to provide resource survey data to State and Federal management agencies and universities participating in SEAMAP activities. This third in a series of SEAMAP environmental and biological atlases presents such data, in a summarized form, collected during 1984 SEAMAP surveys. The area covered in the Gulf of Mexico for all SEAMAP survey activities during 1984 is shown in Figure 1.

MATERIALS AND METHODS

Methodology for the 1984 SEAMAP surveys is similar to that of the 1982 and 1983 surveys. Sampling was conducted within the U.S. Fishery Conservation Zone (FCZ) and state territorial waters.

Plankton abundance and distribution were assessed by four surveys in the Gulf of Mexico. Offshore plankton/environmental data stations only were sampled in April-May (Figure 2), with inshore and offshore plankton sampled in June-July (Figure 3) in conjunction with the SEAMAP Shrimp/Bottomfish Survey. In some cases during the Shrimp/Bottomfish Survey, plankton stations were independent of trawl stations. Combined surveys of offshore and inshore plankton/environmental stations were made in August for mackerel (Figure 4) and November-December for blackfin tuna (Figure 5). Environmental data stations for June-July are shown in Figure 6; Shrimp/Bottomfish Survey stations are summarized in Figure 7. Data are summarized in both Figures 6 and 7 by 10-minute squares.

Vessels that participated in SEAMAP plankton surveys were the NOAA Ship OREGON II (April 20-May 24, August 2-28, and November 29-December 18); Florida Institute of Oceanography vessel BELLOWS (August 25-29); and small, inshore vessels of the LDWF (20 days between August 14 and November 28). Vessels participating in the Shrimp/Bottomfish Survey and concurrently sampling plankton included the NOAA Ship OREGON II (June 6-July 24); GCRL vessel TOMMY MUNRO (6 days between June 9 and July 27); small vessels from the ADCNR (6 days between June 6 and July 26); and vessels of the LDWF (14 days between June 5 and July 24), which collected samples within state territorial waters.

Plankton Surveys

Plankton samples were taken at stations arranged in a systematic grid across the Gulf of Mexico for each plankton survey (Figures 2-5). Such a grid was chosen because of the large survey area. Stations were set at minimum intervals of 30 miles (1/2 degree), with the exception of those by state vessels, which collected plankton samples at each trawl station, and the August survey, in which stations from Brownsville to Barataria were 15 miles apart on transect lines 30 miles apart; from Barataria to Mobile Bay, stations were 15 miles apart on transects 15 miles apart; from Mobile Bay east, stations were 30 miles apart on 30-mile transects. During the April-May survey, intensive 24-hour sampling occurred at two locations (Figure 2) where 24 tows were conducted (12 during daylight and 12 during night), to depths of 50, 100, 200, and 400 m. These stations were designed to determine rates of vertical migration in the water column over a complete cycle.

During the June-July Shrimp/Groundfish Survey, three transects were made by the OREGON II off the coasts of Louisiana and Mississippi. Transect sampling began at 5 fm with a station made every 15 miles in an offshore direction, until five stations were completed.

Louisiana conducted extensive plankton sampling from August-November 1984. Plankton and environmental stations from August 14-October 31 are shown in Figure 4; stations from November 1-November 28 are shown in Figure 5.

Sampling gear and procedures were similar to those recommended by Kramer et al. (1972), Smith and Richardson (1977), and Posgay and Marak (1980). Plankton sampling gear consisted of standard 61-cm bongos and a 2x1-m neuston net for the large vessels. The bongos were fitted with 0.333-mm mesh nets with either hard (PVC) or soft (0.333-mm mesh net) cod ends. A flowmeter was mounted off-center in the mouth of each net to record the volume of water filtered. A time-depth recorder was periodically attached to the cable above the bongos to record the depth and path of the tow. A 50-lb weight was attached approximately 1 m below the bongo frame attachment. The neuston net consisted of a 2x1-m pipe frame fitted with a 0.948-mm mesh net on which the cod end was tied off.

At each plankton station, an oblique bongo tow and surface neuston tow were made. In deep water (more than 95 m), a standard (Smith and Richardson 1977) oblique bongo tow was made, i.e., to 200 m, or to 5 m off the bottom at depths less than 200 m, with a payout speed of 30 m/min, 1-min settling time, and a retrieval speed of 20 m/min, at a vessel speed of 1.5 knots to maintain a 45° angle. In shallow water (less than 95 m), tows were modified to extend tow times to a minimum of 10 min in clear water, or 5 min in turbid water, in order to filter enough water for quantitative purposes. This was accomplished by reducing wire payout and retrieval rates, although during each tow, payout and retrieval rates were held constant so that the water column was sampled uniformly. For all bongo tows, a 45°-wire angle was maintained. Neuston tows were made at the surface with the net half-submerged for 10 min at a vessel speed of 1.5 knots. The Alabama and Louisiana vessels made plankton tows with small, 1/2-m bongo nets with 0.333-mm mesh and soft cod ends.

Samples were preserved initially in 10% buffered formalin. After a 24-hr period, the bongo and neuston samples were transferred to 70% ethyl alcohol for final preservation, and subsequently shipped to the NMFS Miami Laboratory. At that facility, the samples were curated and the sampling data computerized. The right bongo sample and the neuston sample from each station were transshipped to the Polish Sorting Center (PSC) in Szczecin, Poland, for sorting and identification. All ichthyoplankton components (eggs and larvae) were removed from each sample and the fish larvae identified to major groups (families in most cases).

All sorted and unsorted ichthyoplankton specimens were returned to the SEAMAP Archiving Center, managed in conjunction with the FDNR, for long-term storage under museum-like conditions. More than 100,000 specimens collected in 1984, as well as hundreds of thousands collected in 1982 and 1983, are available for loan to researchers throughout the country. Other groups were provided to specialists upon request for identification and analysis. Plankton volumes were determined according to procedures in Smith and Richardson (1977). The left bongo sample from each station was retained in Miami as a backup for those samples transshipped to the PSC, in case of loss or damage during transit. These backup unsorted plankton samples, containing zooplankton and phytoplankton, remained in Miami for one year before being sent to the SEAMAP Invertebrate Plankton Archiving Center, managed in conjunction with GCRL, for storage and use by researchers.

Environmental Surveys

Environmental data were collected at each station sampled during both plankton surveys and the Shrimp/Bottomfish Survey (Figures 2, 4, 5, and 6). Standardized methodology was used although the actual parameters measured varied among vessels participating in each survey. The following parameters were recorded:

- Station: Station identifiers varied by state and vessel.
Cruise: Cruise numbers varied by state and vessels.
Date: Month/Day/Year.
Time: Local time and time zone, recorded at the start of sampling.
Latitude/longitude: Recorded to seconds.
Wind speed and direction: Recorded in kilometers per hour with direction recorded in compass degrees from which the wind was blowing.
Wave height: Estimated visually in meters.
Cloud cover: Estimated visually in percent cloud cover.
Barometric pressure: Recorded in millibars.
Secchi depth: Secchi depth in meters, estimated at each daylight station. Standard oceanographic 50-cm white discs were lowered until no longer visible, then raised until visible. If different depths were recorded, an average was used.

The following parameters were measured at the surface, mid-depth and bottom; for bottom depths greater than 200 m, a maximum depth of 200 m was recorded:

- Water temperature: Temperatures were measured by a hand-held thermometer onboard ship, in situ electronic sensors, and in situ reversing thermometers. No attempt was made to intercalibrate the various instruments used on individual vessels although several vessels did sample together to calibrate other sampling gear. Some error can be expected.
- Salinity: Salinity samples were collected by Niskin bottles and stored for laboratory analysis with a Plessy salinometer. Conductivity probes and refractometers were used on some vessels.
- Chlorophyll: Chlorophyll samples were collected and frozen for later laboratory analysis. The general procedure for shipboard collection of chlorophyll was to collect 3 liters of sea water. The water sample, to which 1 ml 1% (W/V) suspension of MgCO₃ was added, was filtered through GF/C filters, and the filters were subsequently wrapped in opaque material and frozen.
- Laboratory analyses for chlorophyll a and phaeophytin a (chlorophyll degradation product) were conducted by fluorometry and spectrophotometry. The general extraction procedures prior to measurement were similar. Samples analyzed by spectrophotometer included other chlorophyllous products but have not been included as data in this report. The methodology used is described in Strickland and Parsons (1972) and Jeffrey and Humphrey (1975).
- Approximately 10 percent of the values have been deleted from the data base because of analytical errors.
- Dissolved oxygen: Dissolved oxygen values were measured by electronic probes (depending on the vessel) or by the standard Winkler method. No attempts were made to intercalibrate the methods. When oxygen was measured in samples collected from a Niskin sampler, the oxygen bottles were allowed to overflow a

minimum of 10 seconds to eliminate oxygen contamination. The tubing which delivered the water sample was inserted to the bottom of the bottle and withdrawn while the sample was still flowing. The oxygen bottles were sealed with a ground-glass stopper and analyzed onboard the vessels.

Satellite Images

In 1982 and part of 1983, images of the Gulf of Mexico were taken by the Coastal Zone Color Scanner on the Nimbus-7 satellite from which chlorophyll concentrations were determined. The thermal sensor subsequently became unstable and not accurately calibrated, thus chlorophyll plots and sea-surface temperature charts derived from satellite images were not available for 1984.

Thermal data were collected instead by the Advanced Very High Resolution Radiometers (AVHRR) carried on the NOAA Polar Orbiter series of satellites. The data were analyzed by the National Environmental Satellite Data and Information Service (NESDIS).

Shrimp/Bottomfish Survey

Shrimp and bottomfish sampling was carried out from Pensacola, Florida to Brownsville, Texas (Figure 7). Trawl stations made with 40-ft nets covered NMFS shrimp statistical zones 10 through 21 (Figure 8), to a depth of 50 fm.

The sampling strategy and a description of the statistical rationale for the sampling design are described by Nichols in the 1982 SEAMAP Atlas (Gulf States Marine Fisheries Commission 1984). Briefly, the strategy was as follows: sampling sites were chosen randomly in three areas (east of the Mississippi River, west of the Mississippi River to the Louisiana-Texas border, and off Texas) stratified by depth and statistical area (two areas per stratum). In depths of 5-25 fm, stations consisted of 1-fm strata; out to 30 fm, stations covered 2.5-fm strata; and to 50 fm, stations consisted of 5-fm strata. Trawls were towed perpendicularly to the depth contours and covered the entire depth stratum on each station. Single tows were for a maximum of 30 min; for certain stations, a series of consecutive trawl tows was necessary to cover a given depth stratum, with a minimum individual tow across each stratum of 10 min and a maximum tow of 30 min. All offshore stations were sampled at night using a 40-ft shrimp trawl (Gutherz et al. 1985).

The LDWF used small vessels (less than 30 ft) to sample seven study areas in NMFS statistical zones 12, 13, 14, 16, and 17, with 16-ft shrimp trawls during daylight hours. Statistical Zone 15 was not sampled, as stations were made along set transects occurring only in the five other zones with the 16-ft trawl. Six samples were taken weekly in each study area during the survey period. A sampling station consisted of a 1-fm increment at depths from 1-5 fm. Tows were made perpendicularly to shore. Alabama vessels using 16-ft trawls in daylight hours sampled passes leading from Mobile Bay to the Gulf of Mexico, with five stations made in June and five in July.

All Penaeus spp. shrimp were separated from the trawl catch at each station. Total count and weight by species were recorded for pooled trawls within 1-fm strata. A sample of up to 200 shrimp of each species from every trawl tow was sexed and

measured to obtain length-frequency information. Estimated total numbers were derived from the total weights of those processed. Other species of fishes and invertebrates were identified, enumerated and weighed, except on Texas and Alabama vessels, where weights were not recorded. The taking of weights and individual measurements on species other than commercial shrimp was also requested.

Environmental Perturbation Study

As provided for in the SEAMAP Operations Plan: 1985-1990, special survey activities may be scheduled to study specific environmental perturbations, e.g., hypoxia, phytoplankton blooms, and oil spills (GSMFC 1984).

In late July 1984, an oil spill was recorded when a tanker grounded off Cameron, Louisiana. The NOAA Ship OREGON II spent August 11-12, 1984 sampling waters adjacent to the tanker, in conjunction with the ongoing August Plankton Survey, to determine the extent of detrimental effects on the benthos. Ten 10-minute trawl tows were made with a 40-ft standard shrimp trawl, using 8-ft x 40-in wooden chain doors, tickler and loop chain, mud rollers and eight sponge floats. Trawl catches were processed for composition, number and weight of each species; shrimp samples were returned to the laboratory for analysis. Standard SEAMAP environmental sampling was done at each station (Figure 4), along with collection of mud samples by a pipe dredge; these were examined onboard for the presence of oil particles.

RESULTS

Plankton Surveys

Identified ichthyoplankton samples were returned from the PSC to the SEAMAP Archiving Center in July 1986. The data will be verified and incorporated into the SEAMAP data system. Distribution plots, by key families, will appear in the separate 1984 SEAMAP Ichthyoplankton Atlas (in preparation).

Plankton stations for April-May are shown in Figure 2, for June-July in Figure 3, for August in Figure 4, and for November-December in Figure 5.

Environmental Surveys

As detailed previously, environmental data are collected in conjunction with plankton and shrimp/bottomfish surveys. In the 1982 and 1983 SEAMAP atlases, contoured plots of surface and bottom temperatures, salinities, and dissolved oxygen taken from shipboard sensors were included, but because the numbers represent averages over a relatively long period, they were found by the SEAMAP Subcommittee to be generally unusable and are not included in this atlas.

However, satellite-derived surface temperatures, averaged over a few days, are shown for the April-May Plankton Survey (Figures 9-12) and December Plankton Survey (Figures 13 and 14). Few satellite data are available for the June-July Shrimp/

Bottomfish Survey and the August Plankton Survey because surface temperatures tend to be homogeneous throughout the Gulf during summer months, and discrete differences are therefore not discernible to satellite imagery; additionally, the high humidity during that season tends to obscure those gradients that do exist.

A complete listing of selected environmental parameters for all SEAMAP surveys is shown in Table 1. Additional environmental information (Secchi readings, Forel-ule, cloud cover, etc.) may be obtained from the SEAMAP Information System by contacting the program Coordinator.

Shrimp/Bottomfish Survey

The June-July Shrimp/Bottomfish Survey consisted primarily of biological trawl data (Figure 7), and concomitant environmental and plankton data. A species composition listing from the trawls is presented in Table 2, ranked in order of abundance, within the categories of finfish, crustaceans, and other invertebrates. Biological distributions of the 10 most abundant finfish plus red snapper, 3 main penaeid shrimps, 5 most abundant non-penaeid invertebrates, and combined species of squid, taken from Table 2, are displayed in plots of number/hour and lb/hour in Figures 15-54. Data for the biological plots were computed from both the 40-ft trawl data, and from 16-ft trawl data, standardized to 40-ft trawls using relative headrope length. In the plots of lb/hour, a zero value indicates less than 0.5 lb/hr taken; only stations where at least some of the species were taken are shown. No trawl stations were made by the states of Florida or Texas during this survey. No weights were taken in Alabama territorial waters except for penaeid shrimp. Table 3 summarizes environmental data taken in statistical zone 9.

Tables 4a-14a present the biological data, from the 40-ft nets, of the eight most abundant fish, six most abundant invertebrates, and squid combined for all NMFS statistical zones, by depth stratum. Tables 4b-14b present the biological data, from the 40-ft nets, of the 8 most abundant fish, 6 most abundant invertebrates, and squid within each NMFS statistical zone by depth stratum. Tables 4c-14c list the total catch and environmental data from the 40-ft nets by NMFS statistical zone and depth stratum.

Table 15 presents the biological data from the 16-ft nets of the eight most abundant fish, six most abundant invertebrates, and squid combined for all NMFS statistical zones, inside 5 fm. Tables 16-21 present the biological data from the 16-ft nets of the 8 most abundant fish, 6 most abundant invertebrates, and squid within NMFS statistical zones 11, 12, 13, 14, 16, and 17, inside 5 fm. Table 22 presents the total catch and environmental data from the 16-ft nets, by NMFS statistical zone, inside 5 fm.

For all tables, the standard error of the mean (SEM) was calculated with the equation:

$$SEM = \sqrt{\frac{\alpha}{n}}$$

where α is the population standard deviation
and n is the number of the sample.

On all tables, NUM = number per hour; all weights shown are in kilograms per hour.

Real-time Data Management

The SEAMAP Subcommittee agreed it was imperative to the success of the SEAMAP Program to distribute data on a near real-time basis to the fishing industry and others interested in SEAMAP. To distribute near real-time data, NMFS, in cooperation with NASA, installed a data communications terminal aboard the NOAA Ship OREGON II. The terminal was designed to operate through the ATS-3 satellite system located in geostationary orbit over the Pacific Ocean. This enabled personnel aboard the vessel to transmit daily catch rates and environmental data to the NMFS computer system through computer hardware, located at the NMFS Mississippi Laboratories in Bay St. Louis.

Summarized data were distributed weekly to management agencies and the industry as computer plots and data listings. These plots showed stations locations, catches of brown, pink, and white shrimp in lb/hr and count/lb, and total finfish catch in lb/hr.

Environmental Perturbation Study

The catch compositions from the ten trawl stations surrounding the oil spill site are not indicated in this Atlas, but are available on request from the SEAMAP Information System. Shrimp samples analyzed in the NMFS-Pascagoula facility indicated no noticeable levels of oil contamination. Gross examination of site mud samples also did not indicate the presence of oil particles. No evidence of damage (i.e., dying or dead organisms) associated with environmental contamination was noticed from any of the ten trawls.

DISCUSSION

The quasisynoptic SEAMAP sampling program and the intended long-term nature of the sampling programs have been designed to provide the baseline data set needed for fishery management and conservation. For example, the ichthyoplankton samples are used by researchers studying taxonomy, age and growth, bioenergetics, and other life history aspects, as well as spawning biomass and recruitment. In addition, information on species' relative distributions within the Gulf of Mexico can be analyzed with respect to concomitant environmental data to assess population abundance as a function of environmental change. In the same way, satellite data can be related to species distribution and changing conditions in the Gulf.

Similar analyses and investigations are being undertaken with Shrimp/Bottomfish Survey data. In addition, however, this data set is utilized in resource management decisions, and because of the program's ability to process data quickly, the capability exists to optimize some fisheries on a real-time basis. The long-term data set on all of the species collected, not just those of commercial and recreational importance, offers an opportunity to examine ecological relationships, with the eventual goal of developing management models that take into account the multi-species nature of most Gulf fisheries. The value of the SEAMAP Program lies in its use for both immediate and long-range management. There are, in addition, many studies and other uses for SEAMAP data that are not mentioned here.

Much use has already been made of SEAMAP data. For example, during the surveys an area of very low dissolved bottom oxygen was found off Louisiana in 1982, again in 1985 and in May 1986. The presence of this phenomenon and some of the related conditions and biological effects were summarized by Stuntz et al. (1982), and during such occurrences, SEAMAP has distributed special environmental bulletins and news releases to management agencies and the shrimp industry. In addition, SEAMAP data were used by some coastal states to determine the status of shrimp stocks and their movements just as the shrimping seasons were to be opened.

SEAMAP data collected during the Shrimp/Bottomfish Survey continue to be used extensively for fishery management purposes. In 1981, the Gulf of Mexico Fishery Management Council's plan for shrimp was implemented (Louisiana State University, Center for Wetland Resources 1980), with one management measure calling for the temporary closure to shrimping of the FCZ off Texas. This closure complements the traditional closure of the Texas territorial sea, normally June 1-July 15 of each year. The purpose of the closure is to increase the yield of shrimp and eliminate waste caused by discarding of undersized brown shrimp.

NMFS was charged with evaluating the effects of the Texas Closure and several reports were submitted to the Council in December 1984, subsequently summarized by Mathews (1984), reporting size and abundance of commercial shrimp collected by SEAMAP in 1984, and Nichols (1984), describing the impact of the combined Texas territorial sea and FCZ closures on brown shrimp yields. After review of these data and other information, the Council voted to continue the Texas Closure in 1985.

SEAMAP ichthyoplankton data were used to estimate spawning stock sizes of bluefin tuna in the Gulf of Mexico (McGowan and Richards 1986). The results of this work were recognized by the International Commission for the Conservation of Atlantic Tunas as a reliable index of stock size, thus precluding the need for a longline fishery in the Gulf which was proposed by Japan. Continuation of the ichthyoplankton surveys in the spring by SEAMAP will preclude entry of a Japanese longline fishery for tunas, which also have high billfish bycatches.

Data Requests

It is the policy of the SEAMAP Subcommittee that all verified non-confidential SEAMAP data, collected specimens and samples shall be available to all SEAMAP participants, other fishery researchers, and management organizations approved by the Subcommittee. This atlas presents, to those individuals interested in the data or specimens, a chance to review the data in a summary form.

Data and specimen requests from SEAMAP participants, cooperators, and others will normally be handled on a first-come, first-serve, and time-available basis. Because of personnel and funding limitations, however, certain priorities must be assigned to the data and specimen requests. These priorities are reviewed by the SEAMAP Subcommittee. For further information on SEAMAP data management, see the SEAMAP Operations Plan: 1985-1990 (Gulf States Marine Fisheries Commission 1984).

Data requests and inquiries, as well as requests for plankton samples, can be made by contacting the SEAMAP Coordinator, Gulf States Marine Fisheries Commission, P.O. Box 726, Ocean Springs, MS 39564; 601/875-5912.

Table 1. Selected environmental parameters measured during 1984 SEAMAP surveys in the Gulf of Mexico, by individual survey.

40-ft trawls

Summary of dominant organisms taken within statistical zone 10 during the June-July 1984 SEAMAP Shrimp and Bottomfish Survey by depth stratum. The mean number (Num) of organisms per hour, the standard error of the mean (SEM) for numbers, the weight in kg per hour, the SEM of weight and the number (n) of samples taken. No samples were taken below 6 fm.

Table 22
16-ft trawls
0-5 fathoms

Summary of the mean total catch (kg/hr) and environmental data (X), the standard error of the mean (SEM) and the number of samples taken (n) during the June-July 1984 SEAMAP Shrimp and Bottomfish Survey. Catch values in kg, temperature in °C, salinity in ppt, and oxygen in ppm. No sampling was done in statistical zone 15. Statistical zone 11 includes weights by Louisiana vessels from individual species, but not by Alabama vessels for individual species.

	STATISTICAL ZONE											
	10			11			12			13		
Environmental Category	X	SEM	n	X	SEM	n	X	SEM	n	X	SEM	n
Total catch kg	1.8	0.91	3	5.0	1.29	12	4.5	2.41	6	22.7	17.44	6
